## **Amendments to the Abstract**

Please add the following Abstract to this application.

-- Disclosed are a method and bi-directional communication device, such as a cable modem (202), router, bridge, or other communication device adapted to communicate via a network and having a firewall (124), for identifying those packets associated with inappropriate activity. The communication device includes at least one user discernable indicator (126)-associated with the firewall. The at least one user discernable indicator contemporaneously indicates that a number of packets associated with the inappropriate activity has exceeded a threshold level.--
